BWT–SC F

Silicate is the second most abundant element found on earth. All natural water supplies contain some dissolved silica. Many supplies also contain suspended or colloidal silica.

In water treatment, we are concerned with silica because of its tendency to form deposits (scale) on surfaces it comes in contact with.

BWT – SC F is specifically formulated to stabilize silica in water and therefore prevent the formulation of silica scale, without much of blow down rate so, fuel consumption per ton steam can be save.

Appearance	:	clear liquid
Density 30^0C	:	1,25 – 1,3
pH (100 ppm)	:	8,1
